

Sprint 3 Week 1 — Team A/B Role-Based Routing Requirements & Acceptance Criteria

Project: Intern Management System for Social Enterprise Workforce Development

Client: Food Systems Collective (FSC)

Team: Team 40 / Team B

Role: Business Analyst

Business Analyst: Shakthijhaa Sivagnanam

Student ID: s4065078

Sprint: Sprint 3

Week: Week 1

Document Status: Business Analysis routing baseline for DEV/PM implementation and acceptance testing. This document defines the required business outcomes; it does not claim that the final routing has already been implemented or deployed.

1. Purpose

This document defines the Business Analysis rules and testable acceptance criteria for final role-based routing across the integrated Team A / Team B Intern Management System (IMS).

The purpose is to ensure that an authenticated user reaches the correct role-owned workspace using the shared IMS identity and role model, without requiring manual URL navigation or creating a separate Team B identity.

This requirements baseline covers:

- Applicant post-login routing into the Team A Recruitment experience.
- Promoted Intern routing into the Team B Intern workspace using the same shared account/profile.
- Mentor post-login routing into the Team B Mentor workspace.
- Minimum role-access restrictions for normal authenticated navigation and direct role-mismatched navigation.
- Testable acceptance criteria for DEV implementation and BA acceptance validation.

This task does not introduce or redefine full onboarding, administration, Mentor Assignment or Team A Applicant-to-Intern promotion functionality. Team A remains responsible for the promotion action itself; this document defines the routing outcome that must follow from the shared role state.

2. Requirements and Decision Basis

The routing requirements are based on the current Sprint 3 Team A/B alignment together with the previously established Team B shared-identity and access requirements.

The current confirmed routing direction is:

- `shared_accounts.role` is the authoritative business value for workspace routing. `application_status` is not required to select the post-login workspace.
- An Applicant remains within the Team A Recruitment / Applicant experience while the shared account role is Applicant.
- When Team A promotes an accepted Applicant, the same shared account is updated to the Intern role. Team B must reuse that same account/profile rather than create a new Intern identity.
- An Intern should enter the Team B Intern workspace after authentication.
- A Mentor should enter the Team B Mentor workspace after authentication.
- Frontend routing and route handling are a navigation/usability layer. They must not replace API-side authorisation and existing Team B RBAC controls.

The exact route paths, visual fallback page for an unknown role, and low-level implementation method remain DEV/UX implementation details. The business outcomes and access boundaries in this document remain mandatory regardless of the final route names.

2.1 Source Documents Reviewed

1. Team40 Sprint 3 Week 1 — Team A/B Role Routing & Workspace Alignment (PM coordination baseline).
2. Sprint 1 Week 2 — Applicant-to-Intern Transition & Cross-Team Requirements.
3. Sprint 1 Week 3 — Final Team B Core MVP Requirements Baseline.
4. Sprint 2 Week 3 — Team B Shared Authentication, Identity & RBAC BA Acceptance Validation.
5. Current Team A/B shared authentication and role-access direction recorded through PM/DEV coordination.

3. Role-Based Routing Business Rules

ID	Business Rule	Requirement
RR-01	Authoritative routing source	The system shall determine the post-login workspace from the authenticated user's current <code>shared_accounts.role</code> . <code>application_status</code> must not be used as the primary workspace-routing value.
RR-02	Applicant routing	A user whose shared role is Applicant shall remain in the Team A Applicant / Recruitment experience after authentication. The normal login flow must not route the Applicant into Team B Intern or Mentor workspaces.
RR-03	Promoted Intern routing	A user whose shared role has been updated to Intern shall enter the Team B Intern workspace after authentication without requiring manual URL navigation.
RR-04	Same-account continuity	Applicant → Intern promotion must preserve the same shared account/profile identity. Team B must not create a separate unrelated Intern account to support routing.

ID	Business Rule	Requirement
RR-05	Mentor routing	A user whose shared role is Mentor shall enter the Team B Mentor workspace after authentication.
RR-06	Role change precedence	Once the shared role has changed, the newly resolved role shall determine the user's valid workspace. A previous Applicant destination must not remain the default for a promoted Intern.
RR-07	No manual URL dependency	Applicants, promoted Interns and Mentors shall reach their appropriate workspace through the authenticated flow rather than by manually editing or entering role-specific URLs.
RR-08	Previous URL / next-route safety	A stored or requested destination may only be honoured when it is permitted for the authenticated user's resolved role. A stale or role-mismatched destination must not override the user's role boundary.
RR-09	Unknown / missing role handling	If no supported routing role can be resolved, the system must not route the user into a privileged role workspace by default. The exact safe fallback experience may be defined by DEV/UX.
RR-10	Scope boundary	Routing must reuse the shared authentication/account/profile foundation and must not duplicate Team A promotion logic, create a full onboarding flow, or introduce a separate Team B identity model.

3.1 Applicant Routing Rule

The Applicant routing rule applies while the authenticated shared account role remains Applicant.

Required behaviour:

- The user enters or remains within the Team A Applicant / Recruitment experience after authentication.
- The Applicant is not presented with the Team B Intern workspace as the normal post-login destination.
- The Applicant is not presented with the Team B Mentor workspace as the normal post-login destination.
- Applicant application and recruitment functionality remains owned by Team A.
- No Team B routing rule may treat an Applicant as an Intern solely because an application record exists or an application status appears successful.

3.2 Promoted Intern Routing Rule

The promoted Intern routing rule applies after Team A has completed the accepted Applicant → Intern promotion and updated the existing shared account role to Intern.

Required behaviour:

- The same shared account/profile continues to represent the user after promotion.
- The promoted user enters the Team B Intern workspace on the authenticated flow.
- The Team A Applicant application workspace must not remain the promoted Intern's default post-login destination.

- Team B must recognise the user through the shared Intern role and shared identity; it must not require a separate Team B registration or login.
- The historical Team A recruitment/application record may remain available within Team A ownership, but it does not determine the Intern's default workspace after promotion.

The promotion mechanism itself remains Team A-owned. Team B's requirement begins from the point where the shared account role is available as Intern.

3.3 Mentor Routing Rule

The Mentor routing rule applies when the authenticated shared account role is Mentor.

Required behaviour:

- The Mentor enters the Team B Mentor workspace after authentication.
- The normal authenticated flow must expose Mentor-owned navigation and functions rather than Applicant or Intern workspace navigation.
- Mentor access must continue to use the authenticated shared account identity and existing Team B role/RBAC controls.
- A Mentor role alone must not grant unrestricted access to unrelated Intern data; existing Mentor–Intern access restrictions remain in force.

4. Minimum Role-Access Restrictions

Role-based routing must prevent users from being presented with or using another role's protected workspace through the normal authenticated flow. Frontend routing is not a substitute for backend authorisation.

ID	Access Case	Required Behaviour
AR-01	Applicant → Team B Intern workspace	Must not be the normal post-login route. Direct access must not expose Intern-only protected data or functions.
AR-02	Applicant → Team B Mentor workspace	Must not be the normal post-login route. Mentor-only protected data/actions must remain unavailable.
AR-03	Intern → Team A Applicant workspace	Must not remain the default route after promotion. A stale Applicant destination must not override the current Intern role.
AR-04	Intern → Team B Mentor workspace	Must not expose Mentor-only functions or data.
AR-05	Mentor → Team B Intern workspace	Must not provide Intern-self-service access as though the Mentor were that Intern. Mentor access to Intern data must occur only through permitted Mentor workflows/relationships.
AR-06	Direct role-mismatched navigation	The wrong role workspace must not be usable. The frontend may redirect or present a safe access state, while the API must continue rejecting unauthorised data access.

ID	Access Case	Required Behaviour
AR-07	Stored previous URL / next parameter	May only be used when compatible with the current authenticated role. Role safety takes precedence over convenience redirects.
AR-08	Unknown or unsupported role	Must not default to Applicant, Intern or Mentor privileged workspace. Use a safe neutral/error path until a supported role is resolved.

4.1 Minimum Access Principle

The business rule is not that every user receives access to every workspace and the UI simply hides irrelevant controls. The authenticated role must determine which workspace is appropriate, and protected role-specific data/actions must remain controlled by the existing API authorisation layer.

Where a user attempts a role-incompatible route, acceptance is based on the incorrect workspace not being usable and protected data not being exposed. The exact visual response—redirect, access-denied state, or another safe fallback—may be confirmed during implementation.

5. Testable Acceptance Criteria

The following criteria are written for DEV implementation and later BA acceptance validation against the integrated deployed build.

ID	Focus	Acceptance Criterion
AC-RR01	Applicant routing	Given an authenticated user has <code>shared_accounts.role = Applicant</code> , when login completes, then the user is taken to the Team A Applicant / Recruitment experience without manually entering a Team A URL.
AC-RR02	Applicant negative access	Given the authenticated user is Applicant, when a Team B Intern or Mentor workspace is requested through the normal flow or direct navigation, then the user must not receive usable access to that role's protected workspace/data.
AC-RR03	Promoted Intern routing	Given Team A has promoted an accepted Applicant by updating the same shared account role to Intern, when that user authenticates, then the user enters the Team B Intern workspace without manual URL navigation.
AC-RR04	Same-account continuity	Given the same person has been promoted from Applicant to Intern, when Team B resolves the authenticated user, then the account/profile identity remains the same shared identity rather than a newly created Team B account.
AC-RR05	No Applicant default after promotion	Given the user's current shared role is Intern, when authentication completes, then the Team A Applicant/application workspace must not remain the user's default destination.

ID	Focus	Acceptance Criterion
AC-RR06	Mentor routing	Given an authenticated user has shared_accounts.role = Mentor, when login completes, then the user enters the Team B Mentor workspace without manual URL navigation.
AC-RR07	Intern cannot use Mentor workspace	Given the authenticated user is Intern, when the Mentor workspace is directly requested, then Mentor-only content/actions must not be usable and protected Mentor data must not be returned.
AC-RR08	Mentor cannot use Intern self-service workspace	Given the authenticated user is Mentor, when an Intern self-service workspace is directly requested, then the Mentor must not be treated as that Intern and must not receive unrelated Intern-self-service data.
AC-RR09	Stale previous destination	Given the user's role has changed or a previous destination belongs to another role, when login completes with that old destination available, then current shared_accounts.role takes precedence and the user must not be routed into the incompatible workspace.
AC-RR10	Unknown role safety	Given the authenticated account has no supported Applicant, Intern or Mentor routing role, when login completes, then no privileged role workspace is selected by default and the user receives a safe fallback/error outcome.
AC-RR11	Backend authorisation retained	Given a role-mismatched protected API request is made, when backend authorisation is evaluated, then unauthorised data access remains denied regardless of frontend routing behaviour.
AC-RR12	Regression expectation	Given role-based routing is deployed, when existing Team B Intern and Mentor users enter their correct workspaces, then the existing Team B Task, Weekly Progress and minimum Mentor/Intern RBAC flows continue to operate without regression.

6. Role Routing Acceptance Matrix

Role	Expected Default Workspace	Team A Applicant	Team B Intern	Team B Mentor	Notes
Applicant	Team A Applicant / Recruitment workspace	Yes	No	No	Applicant remains in Team A experience.
Intern	Team B Intern workspace	No default after promotion	Yes	No	Same shared account/profile after Team A promotion.
Mentor	Team B Mentor workspace	No	No self-service Intern context	Yes	Mentor uses Team B Mentor functions subject to relationship/RBAC rules.

7. Scope Boundaries and Implementation Clarifications

The following items are deliberately separated from the confirmed business rules so that unresolved technical or UX details are not misrepresented as BA decisions.

ID	Implementation Item	BA Position
IC-01	Exact route paths	DEV may confirm the final Applicant, Intern and Mentor route paths. Acceptance is based on the correct role-owned destination, not a specific URL string unless later agreed.

ID	Implementation Item	BA Position
IC-02	Unknown-role fallback UI	The exact safe fallback page/message remains a DEV/UX decision. The requirement is that no privileged role workspace is selected by default.
IC-03	Redirect implementation	DEV may determine whether routing occurs in AuthPage.tsx, a shared route guard, middleware or another shared frontend mechanism, provided the business rules are met.
IC-04	Role refresh timing	The implementation must resolve the current shared role strongly enough that a promoted Intern is not kept in the Applicant default experience. Exact token/session refresh mechanics are technical.
IC-05	Team A promotion logic	Team A owns the Applicant → Intern role update. Team B must consume the shared outcome and must not duplicate the promotion process.
IC-06	API protection	Existing backend authorisation remains authoritative. Frontend role routing/guards provide navigation control and must not weaken API-side access restrictions.

8. BA Final Outcome

The Sprint 3 Week 1 role-based routing baseline is defined and ready for DEV implementation and PM review.

The required business outcome is a single shared IMS login experience in which the authenticated user's current `shared_accounts.role` determines the correct workspace: Applicant → Team A Applicant experience, promoted Intern → Team B Intern workspace using the same shared identity, and Mentor → Team B Mentor workspace.

The routing baseline also defines the minimum negative access expectations required to prevent a user from being presented with or using another role's protected workspace through the normal authenticated flow. Frontend routing must work together with, and must not replace, existing API authorisation.

All five Planner checklist requirements are covered by this document. Exact route names and low-level routing mechanics may be finalised by DEV/UX provided the confirmed business outcomes and access restrictions remain satisfied.
