

CROSS-TEAM INTEGRATION DECISION RECORD

Team A/B Authentication, Account & Identity Alignment - Sprint 2 Week 3

Document Information

Project	Intern Management System - Team 40 / Team B
Prepared by	Jianqi Lu - Project Manager
Date	1 October 2026
Purpose	Record the confirmed Team A/B authentication, account continuity, role/access and implementation-boundary decisions required before Team B shared integration work.

Confirmed Existing Foundation

Area	Confirmed Direction / Current State
Authentication	Team B will reuse Team A's existing Supabase authentication rather than create a separate Team B authentication system. Team A advised that the frontend account creation/authentication functions are under lib/auth and use the Supabase client.
Shared account	Shared user accounts are stored in the shared_accounts table. Team B should build against this shared account foundation rather than introduce duplicate Team B account records.
Role source	Team A confirmed that account role should be identified using the role column in shared_accounts . This shared role is the basis for deciding whether a logged-in account should receive Applicant, Intern, Mentor or other permitted access.
Existing RBAC	Team A advised that RBAC already exists to some extent, mainly for Admin-role verification. Team B should extend/consume the shared role structure only as required for Intern and Mentor access rather than build a separate RBAC model.

Applicant -> Accepted -> Intern Handoff

The agreed direction is to retain one shared account and one login throughout the applicant-to-intern lifecycle. An accepted applicant should not receive a second Intern account. Team A confirmed that its current transition approach checks **persons_profile.application_status**; when the application status is **Accepted**, the Applicant can transition to Intern access by changing the role/access associated with the same account.

Lifecycle Stage	Account / Access Behaviour
Applicant	User keeps the shared account and receives Applicant-side access for the recruitment/application workflow.
Accepted	Team A checks the application status in persons_profile . Accepted status is the trigger for the transition.
Intern	The same account/login continues, with the shared role/access changed to Intern so the user can enter the Team B Intern workspace.
Mentor	Mentor access should also be resolved through the shared account role and lead to the Team B Mentor workspace rather than a separate authentication model.

Mentor-Intern Relationship & Ownership

Team A confirmed that it is not currently implementing the Intern-Mentor relationship. Team B will therefore own the minimum Mentor-Intern relationship required for the Intern Management workflow. This relationship should remain compatible with the shared account/role foundation and should support the confirmed Team B Core MVP without expanding into a full mentor-assignment system during Sprint 2.

Implementation Boundary

Area	Primary Direction / Ownership
Existing authentication & shared account foundation	Reuse Team A/shared Supabase authentication, lib/auth and shared_accounts .
Applicant / recruitment / Accepted status	Team A side of the shared IMS.

Area	Primary Direction / Ownership
Applicant -> Intern transition	Team A is implementing the transition using Accepted application status and the same shared account.
Intern / Mentor workspace integration	Team B consumes the shared role/identity and connects it to the existing Team B Core MVP.
Mentor-Intern relationship	Team B owns the minimum relationship required for the Team B workflow.

DEV Handoff / Remaining Implementation Detail

Before implementing Team B authentication integration, DEV should review Team A's existing **lib/auth** implementation and the shared schema to confirm the exact mapping between the currently authenticated Supabase user and the corresponding **shared_accounts** record. This is an implementation-level detail and should reuse the existing Team A mapping. DEV should not introduce a separate Team B identity/account approach.

Any unexpected schema, authentication or backend dependency should be raised before introducing unsupported assumptions or duplicate account/identity logic.

PM Outcome

Cross-team alignment is complete at the PM/architecture level. Team B has a confirmed shared-account direction, same-account Applicant-to-Intern continuity, shared role/access direction, Mentor-Intern ownership boundary and DEV handoff. The remaining exact authenticated-user mapping is to be verified by DEV from the existing implementation during integration.

Evidence basis: This record reflects the Team A responses provided during the cross-team alignment discussion, including confirmation of Supabase/shared_accounts usage, the shared_accounts role column, same-account Applicant-to-Intern transition via Accepted application status, existing Admin-focused RBAC, and Team A's current non-ownership of the Mentor-Intern relationship.
