

Team A/B Role Routing & Workspace Alignment

Team 40 (Team B) | Sprint 3 - Week 1 | PM coordination deliverable | 9 October 2026

Planner task: [CROSS-TEAM INTEGRATION] - Team A/B Role Routing & Workspace Alignment : 120

Purpose: Align the final post-login experience across Team A and Team B so an authenticated user reaches the appropriate workspace without manually editing the URL. This document records coordination decisions and implementation handoff; it is not evidence that Week 1 routing has already been deployed or accepted.

1. Confirmed cross-team decisions

- Authoritative routing value: Team A confirmed that `shared_accounts.role` should be used for workspace routing; `application_status` is not required for this decision.
- Applicant promotion: Team A confirmed that the same account's `shared_accounts.role` is updated to Intern when the Applicant is promoted.
- Shared identity: Team B should continue using the existing shared authentication/account-profile model rather than creating a separate Team B account or duplicating Team A's promotion process.
- Design agreement: Ilya agreed in principle that users should automatically be directed to the pages appropriate for their role (his wording: "seems about right").

2. Target post-login routing contract

Shared account role	Expected destination	Ownership / behaviour
Applicant	Team A Applicant workspace	Existing recruitment/application experience
Intern	Team B Intern workspace	Same account after Team A promotion; no return to application workspace as default
Mentor	Team B Mentor workspace	Mentor-specific experience

Exact destination paths, fallback behaviour for unknown roles, and any existing redirect-to-previous-page rules require implementation confirmation. The table defines the agreed target behaviour, not a claim of completed routing.

3. Existing implementation and identified gap

- Frontend entry point reported by Ilya: `app/components/Auth/AuthPage.tsx`, within the `HandleSubmit` function.
- Current behaviour reported by Ilya: after login, the frontend redirects to a previously requested URL or directly to the application page; this behaviour needs revision for automatic role routing.
- Existing protection: Ilya reported that API role protections exist, but frontend role protection is not currently implemented.
- Remaining gap: role-aware post-login redirect and suitable frontend route protection must be implemented and verified. Frontend guards are a usability/navigation layer and do not replace API authorisation.

4. Ownership and DEV implementation handoff

Owner	Required follow-up
Team A / Ilya	Confirm integration into existing <code>AuthPage.tsx</code> login flow, current redirect behaviour, relevant routes, and any shared-code coordination or review needed. Maintain Applicant promotion and shared role updates.

Owner	Required follow-up
Team B / Chan (DEV)	Coordinate with Team A; implement role-based post-login routing using shared_accounts.role; preserve shared identity and API protection; add appropriate frontend route handling/guards; deploy and regression-check existing Team B flows.
Team B / Farid (UX)	Review Applicant/Intern/Mentor entry experience, role-specific navigation and visible controls; provide focused corrections.
Team B / Shakhijhaa (BA)	Define and independently validate routing/access acceptance criteria; record PASS / FAIL / BLOCKED evidence.
Team B / Jianqi (PM)	Coordinate ownership, dependencies, review and handoff; track unresolved integration decisions and final acceptance.

5. Acceptance scenarios for Week 1

- Applicant login opens the Team A Applicant workspace without manual URL editing.
- After Team A promotes an Applicant, the same account logs in as Intern and opens the Team B Intern workspace.
- Mentor login opens the Team B Mentor workspace.
- Direct navigation to a different role's protected workspace is appropriately handled; unauthorised data access remains denied by the API.
- Existing Team B Task lifecycle, Weekly Progress and minimum Mentor/Intern RBAC continue working after deployment.
- BA records results and evidence against the deployed integrated build.

6. Open implementation checks

- Confirm exact Applicant, Intern and Mentor route paths and how previous-URL redirects should behave for a user whose role has changed.
- Confirm where shared role data is resolved/refreshed after login, including behaviour when the account is promoted between sessions.
- Confirm ownership and PR/review workflow for changes to shared frontend authentication code.

Status as of 9 October 2026: Cross-team routing direction and authoritative role source aligned; technical entry point identified. Implementation, frontend guards, deployment and independent acceptance remain to be completed.
